Enrique Tirado.

The Don Melchor Vineyard is located six meters a.s.l. at the foot of the Andes Mountains on the northern bank of the Maipo River. It consists of one hectare of Cabernet Sauvignon (93%) and Cabernet Franc (7%).

PLANTATION YEAR & DENSITY
1979–2002; 2,000–4,000 plants/hectare.

SOIL
The first 30 cm of soil is loam with a large amount of stones below that. These soils ensure good drainage and low fertility, which helps restrict the plants’ vegetative growth and encourages the accumulation and maturation of phenolic compounds.

CLIMATE
In general the vineyard has a semi-arid Mediterranean climate with an average rainfall of 350 mm per year. It is planted in one of the coldest sectors of the Alto Maipo Valley.

A slower than usual maturation and a tremendous difference between daytime and night time temperatures allowed us to pick the grapes later than in previous years. The climatic conditions coupled with intense vineyard segmentation allowed us to follow maturation levels closely and wait patiently for the tannins to truly ripen while conserving the fresh fruit expression of Cabernet Sauvignon from Puente Alto.
